```
The present sequence encodes human neutral sphingomyelinase (N-SMase).

CC A host cell containing a vector comprising a nucleotide sequence concoding N-SMase can be used to produce N-SMase. N-SMase can be used in a method for identifying a compound useful in the diagnosis or treatment concleotide sequence encoding N-SMase related disorder. N-SMase, and a concleotide sequence encoding N-SMase, can be used for modulating N-SMase can be used for modulating N-SMase can be used for modulating N-SMase. The concleotide sequence or conservation, inflammatory disorder, arthritis, osteoarthritis, crohn's conservation, inflammatory disorder, arthritis, osteoarthritis, contral conclusion system disorder, vascular restenosis, arterial occlusion arising conservation, cardiac disease where LV dysfunction occurs, chypercholesterolaemia, cholesteryl ester storage disorder, renal failure, contral infection, depression, schizophrenia, neurodegeneration, and contral conclusion and contral conclusions and contral co

                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                          Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents one of 5191 Staphylococcus aureus DNA sequences CC of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access CC memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using Ct the S.aureus DNA sequences allows putative functions to be assigned so CC that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are CC likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The CC saureus in a sample. S.aureus is implicated in numerous human diseases, CC including cellulitis, eyelld infections, food poisoning, osteomyelitis, CC skin and surgical wound infections, scalded skin syndrome, toxic shock CC syndrome, etc. Organisms transformed with the DNA sequences can be used CC (and their fragments) are useful as primers or probes for isolating CC homologues of any of the S.aureus DNA sequences contained on the
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

```

A computer readable medium has been developed which has recorded on it 982 nucleotide sequences isolated from the Enterococcus faecalis genome X12938 to X13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer based system can identify fragments of the Enterococcus faecalis genome with

can identify fragments of the Enterococcus faecalis genome wit commercial importance. The products can be used to detect the of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcal infection in an animal and monitoring

be used for

                                                                                            В
                                                                                                                                                                                                                                                                            This invention describes a novel method for the induction by pathogen resistance in plants, by transformation with an expression cassette conductible promoter can be used to drive expression of a heterologous protein. The heterologous protein used in the method of the invention is can antipathogenic protein e.g. chitinase, glucanase, osmotin, lectins, can antipathogenic protein soldated from Mirabilis jalapa, churingiensis, or antifungal proteins isolated from Mirabilis jalapa, amaranthus, Raphanus, Brassica, Sinapis, Arabidopsis, Dahlia, Cnicus, Clathyrus, Clitoria, Allium seeds, Aralia and Impattens and albumin-type proteins, such as thionine, napin, barley trypsin inhibitor, cereal gladin and wheat-alpha-amylase, or a protein that can induce a chypersensitive response, such as Cf, Bs3 and Po proteins from tomato and isochorismate synthase entC gene which is described in the method of the invention.
                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel method for the induction of pathogen cresistance in plants, by transformation with an expression cassette harboring a gene coding for an isochorismate synthase (ICS). A pathogen inducible promoter can be used to drive expression of a heterologous protein. The heterologous protein used in the method of the invention is an antipathogenic protein e.g. chitinase, glucanase, osmotin, lectins, saccharide oxidase, oxalate oxidase, magainins, toxins from Bacillus thuringiensis, or antifungal proteins isolated from Mirabilis jalapa, Amaranthus, Raphanus, Brassica, Sinapis, Arabidopsis, Dahlia, Cnicus, Lathyrus, Clitoria, Allium seeds, Aralia and Impatiens and albumin-type proteins, such as thionine, napin, barley trypsin inhibitor, cereal typersensitive response, such as Cf, Bs3 and Po proteins from tomato and N-protein from tobacco. This sequence encodes the Catharanthus roseus isochorismate synthase ICS protein which is described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

```
The present invention describes a computer readable medium which has C the nucleotide sequences SEQ ID NO:1 to 391 (V52134 to V52524) recorded CC on it, or a representative fragment or a sequence at least 95% identical CC SEQ ID NO:1 to 391. The nucleotide sequences depicted in SEQ ID NO:1 to 391 (V52134 to V52524) are genomic fragments from Streptococcus CC pneumoniae. The present invention also describes an isolated nucleic acid CC molecule encoding a homologue of any of the fragments of the S.pneumoniae genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced CC by a process comprising: (a) screening a genomic DNA library using as a CC probe a target sequence defined by any of the sequences in SEQ ID NO:1 to 391, identifying members of the library which contain sequences (and the sequences of the target sequence and isolating the nucleic acid completer to the target sequence and isolating the nucleic acid completer to the target sequence and isolating the nucleic acid completer sequence is homologous to amplification primers derived from the sequences of the S. pneumoniae genome to prime the amplification and collating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying fragments of the S. pneumoniae genome. Products from the present CC invention can be used in diagnosis kits and assays, and pharmaceutical compositions and vaccines for S. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                 harboring a gene coding for an isochorismate synthase (ICS), A pathogen inducible promoter can be used to drive expression of a hetcrologous protein. The heterologous protein used in the method of the invention is an antipathogenic protein e.g. chitinase, glucanase, osmotin, lectins, saccharide oxidase, oxalate oxidase, magainins, toxins from Bacillus thuringiensis, or antifungal proteins isolated from Mirabilis jalapa, Amaranthus, Raphanus, Brassica, Sinapis, Arabidopsis, Dahila, Cnicus, Lathyrus, Clitoria, Allium seeds, Aralia and Impatiens and albumin-type proteins, such as thionine, napin, barley trypsin inhibitor, cereal gliadin and wheat-talpha-amylase, or a protein that can induce a hypersensitive response, such as Cf, Bs3 and Po proteins from tomato and Protein from tobacco. This sequence encodes the Pseudomonas fluorescens
                          isochorismate synthase orfA protein and the isochorismate pyruvate lyase orfD protein which are described in the method of the invention.
                                                                                                                                                                                                                                                                                   Claim
                                                                                                                                                                                                                                                                                                            Method for inducing pathogen resistance
                                                                                                                                                                                                                                                                                                                                         WPI; 1999-610856/52.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequence of the Methanococcus jannaschil circular chromosome. The present invention describes M. Jannaschil circular chromosome. The genome sequence. The invention also describes a computer based system for identifying fragments of the M. Jannaschil genome that are homologous to target nucleotide sequences, comprising: (a) data storage means comprising the nucleotide sequence of the 164976, 58407 or 16550 by sequence (see v21209, v21210 and v21211), or a nucleotide sequence at least 99.9% identical to it; (b) search means for comparing a target sequence to the nucleotide sequence of the data storage means to identify a homologous sequence, and (c) retrieval means for obtaining the homologous sequence. The method, which is based on whole genome of which consists of 3 physically distinct elements, a large circular extra-chromosoma (the 164976 by sequence given in v21209), alarge circular extra-chromosomal element (the 58407 bp sequence given in v21210), and a small circular extra-chromosomal element (the 16550 bp sequence given in v21210), and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel isolated Streptococcus pneumoniae polynucleotides (see 296173-296494) and their encoded proteins (see 185792-186182). The DNA, vectors and host cells described in the method of the invention are useful for the recombinant expression of the polypeptides. The polypeptides are useful for treatment or prevention of disease, or diagnosis of disease related to expression or activity of such a polypeptide. They can also be used to screen for compounds which interact with and inhibit or activate such a polypeptide. The polypeptides (or DNA encoding them, via gene therapy) are also useful for inducing an immunological response in a mammal. The antagonists are useful to inhibit such bacterial polypeptides. The polypeptides are particularly useful to identify antimicrobial compounds and antibiotics. They are also useful to determine their role in pathogenesis of infection, dysfunction and disease.
                                                                                                                                                                                                                                1149

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of saureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelld infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for the composition of the composition of the composition of the composition and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for the composition of the composition of the composition of the DNA sequences can be used for the composition of the composition of the composition of the DNA sequences can be used for the composition of the DNA sequences can be used for the composition of the DNA sequences can be used for the composition of the DNA sequences can be used for the composition of the DNA sequences can be used for the composition of the DNA sequences can be used for the composition of the DNA sequences can be used to the the DNA sequences can be used to the DNA sequences can be used

                                                    can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcal infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the
                          another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal
                                                                                                                                                          982 nucleotide sequences isolated from the Enterococcus faecalis X12938 to X13919 represent these nucleotide sequences which are nucleotide sequences, also known as contigs. The computer-based
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1051

               recombinant phage DNA. The PEP4 prod., a vacuolar, aspartyl protease capable of self-activation, as well as subsequent activation of additional vacuolar proteases, e.g. carboxypeptidase and proteinase B may be mutated to create a proteolysis-deficient strain of Pichia which may be used for recombinant expression of proteolytically sensitive proteins, e.g. EGF, GRF and IGF-1. See also Q29938-41.
                                                                                                                                        a lambda based EMBL3 P. pastoris genomic DNA library by its ability to hybridise with a radiolabelled fragment of the homologous Saccharomyces cerevisiae PEP4 gene. The P. pastoris PEP4 gene was cloned by isolating positive plaques contg. the hybridising recombinant phage DNA. The PEP4 prod., a vacuolar accombinate pages of contents of cont

This sequence corresponds to the tobacco (Nicotiana tabacum) anthranilate synthase gene ASA2. The gene's promoter and DNA constructs containing it are useful for imparting, to a plant cell, tolerance to an amino acid analogue of Trp, or altering the Trp content in a plant by transforming the plant cells with an expression cassette containing the ASA2 structural gene. The promoter and construct are useful for the production

The enzyme may be used to modulate the amount of lipid, carbohydrate and sugar produced by organisms.

The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (V52134 to V52524) recorded on it, or a representative fragment or a sequence at least 95% identical to SEQ ID NO:1 to 391. The nucleotide sequences depicted in SEQ ID NO:1 to 391 (V52134 to V52524) are genomic fragments from Streptococcus pneumoniae. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S.pneumoniae genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced by a process comprising: (a) screening a genomic DNA library using as a probe a target sequence defined by any of the sequences in SEQ ID NO:1 to 391, identifying members of the library which contain sequences that hybridise to the target sequence and isolating the nucleic acid molecules from the members; or (b) isolating mNNA, DNA or CDNA produced from an organism, amplifying nucleic acid molecules whose nucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       314 286 1800
314 286 1810
200401) was used to synthesize the CDNA. First-strand synthesis was performed with 5-methyl dCTP, hence the ligated cDNA was hemimethylated. A modification of Stratagene's first-strand synthesis primer was used. An 'anchor' nucleotide (V=A, C, or G) was added to the 3' end of the primer [GACAGAGAGAGAGAGAGAGTCTCCAG(T)].BV] to anchor the primer at the 5' end of the poly(A) tract. After second strand synthesis, the cDNA ends were filled in with cloned Pfu DNA, ligated to EcoR1 adapters and subsequently phosphorylated. The cDNA was then precipitated and redissolved in sterile, RNase-, DNase-free water. The XhoI site within the first-strand synthesis primer was then restricted by digestion with XhoI from Promega (40Vul); all XhoI sites in the cDNA would be protected by their hemimethylated status. The cDNA constructs were size-fractionated with a 500 bp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note-"Vector: pBluescript II XR; Site_1: EcoRI; Site_2: XhoI; This cDNA library was constructed from mRNA isolated from cotyledons of 8-day-old 'Williams' seedlings which were propagated on paper towels with distilled water for 3 days (etiolated), then greenhouse grown for 5 days in potting soil. The cotyledons were flash-frozen in liquid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /tissue_type="Cotyledons of 8-day-old·/Williams/
seedlings"
